# Installing ODBC driver using the Windows installer

## Install the driver

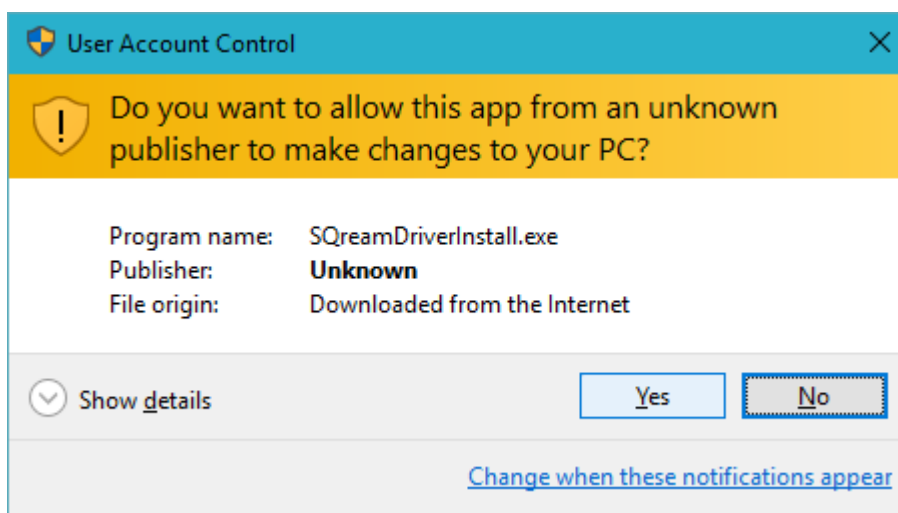

1. Contact SQream support team to download the driver.

If you are not running the latest version, make sure to obtain the correct driver for your version.

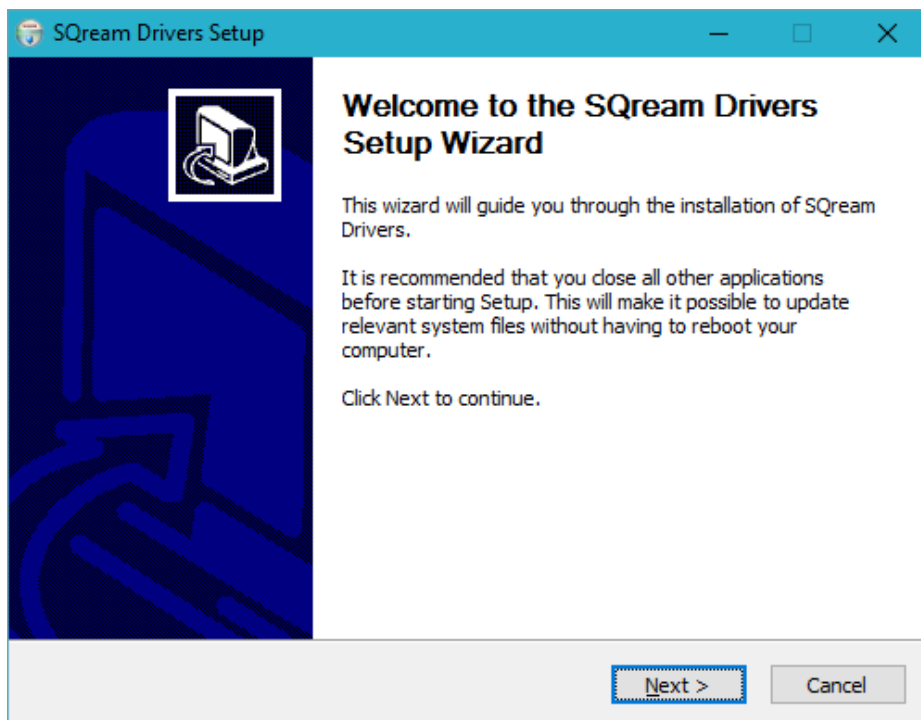

2. Run the installer and follow the steps in the Wizard.

3. The **User Account Control** window may open.

Click **Yes** to continue the installation.

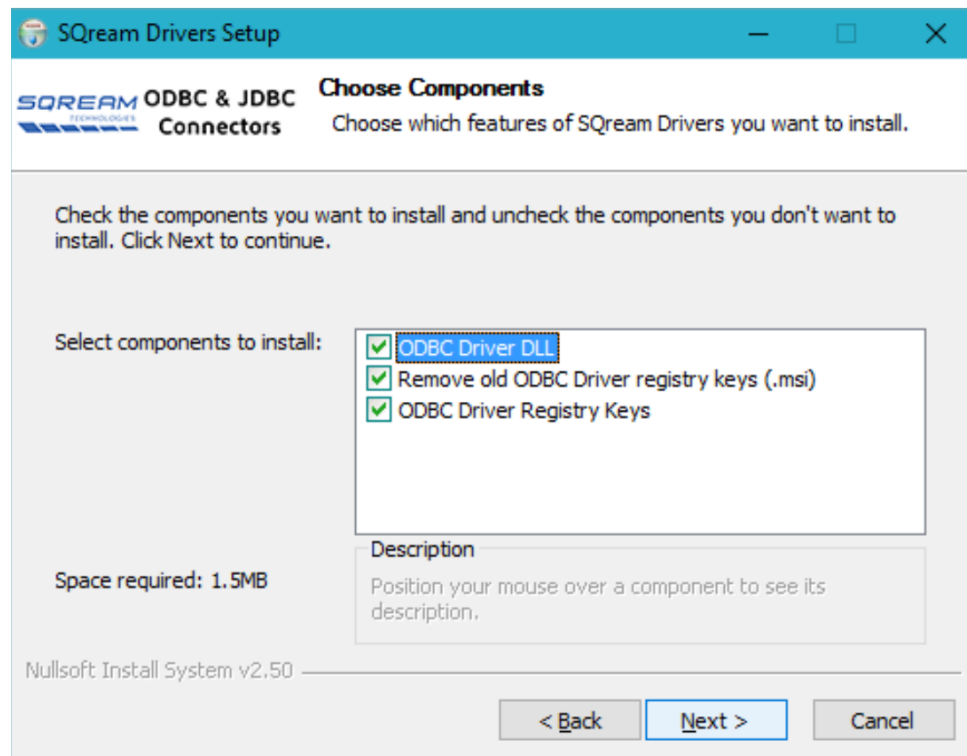

4. Follow the installation instructions.

Choose the components you wish to install.

#### NOTE:

If you have a previous version installed, make sure **Remove old JDBC Driver Registry** is selected.

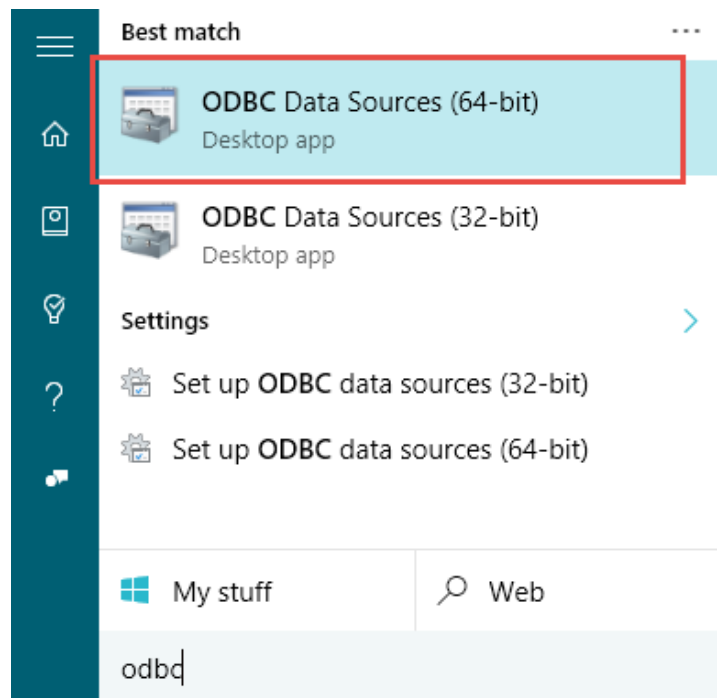

## Create and configure the ODBC Data Source

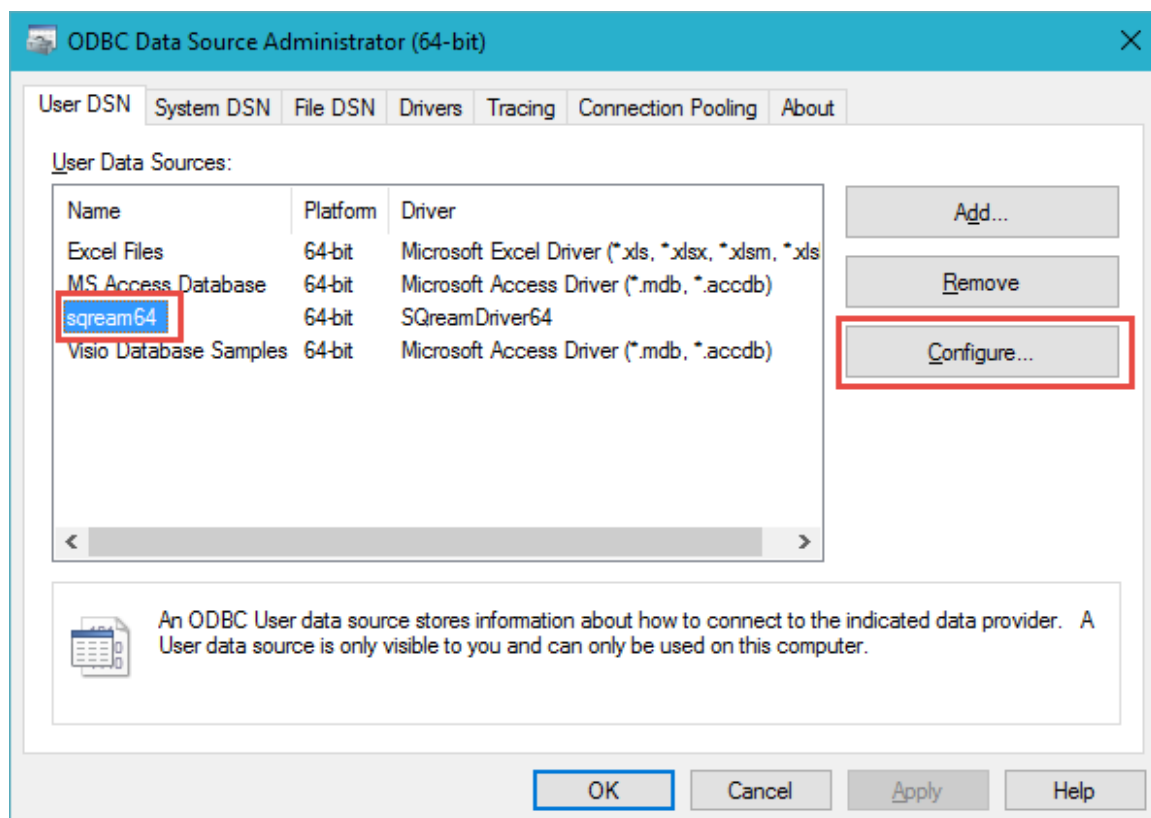

1. Once the installer finishes, enter the ODBC Data Sources window in order to properly set up your connection:

Open up the Windows menu: Clicking the Windows icon  in your toolbar and type **ODBC**.

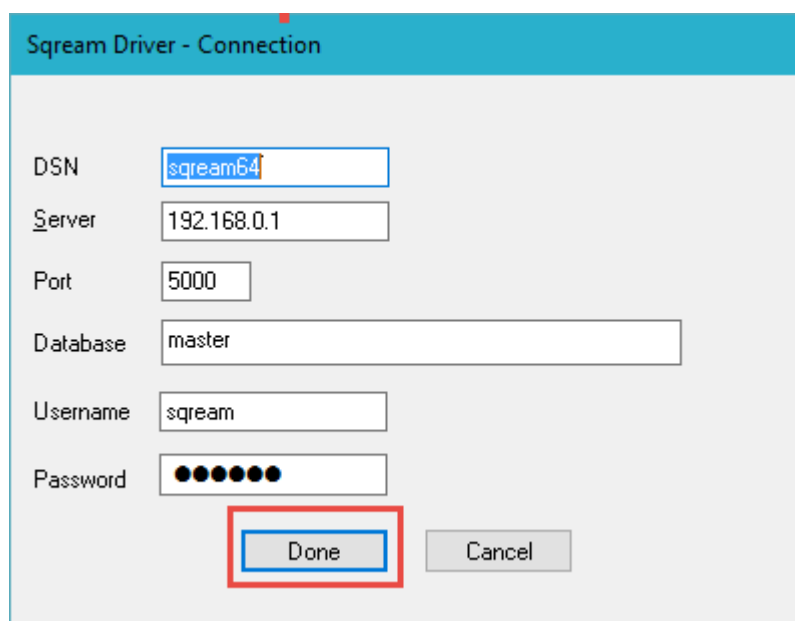

Select the ODBC Data Sources appropriate for your system (usually 64-bit).

2. In the ODBC Data Source Administrator window locate the correct DSN. The installer automatically added a DSN called **sqream64**.

- Click **Configure** and enter the correct server details, as obtained from the SQream support team, in the **SQream Driver - Connection** screen.

- Click **Done** and then **OK** to save the connection settings.

You can now test the ODBC installation with any tool that supports ODBC.
