# Configuring the SQL Workbench Client

## Recommended method - Fresh install

### (Windows x64)

1. Download the latest installer here: <https://sqream.com/product/client-drivers/> (choose JDBC Windows Installer).

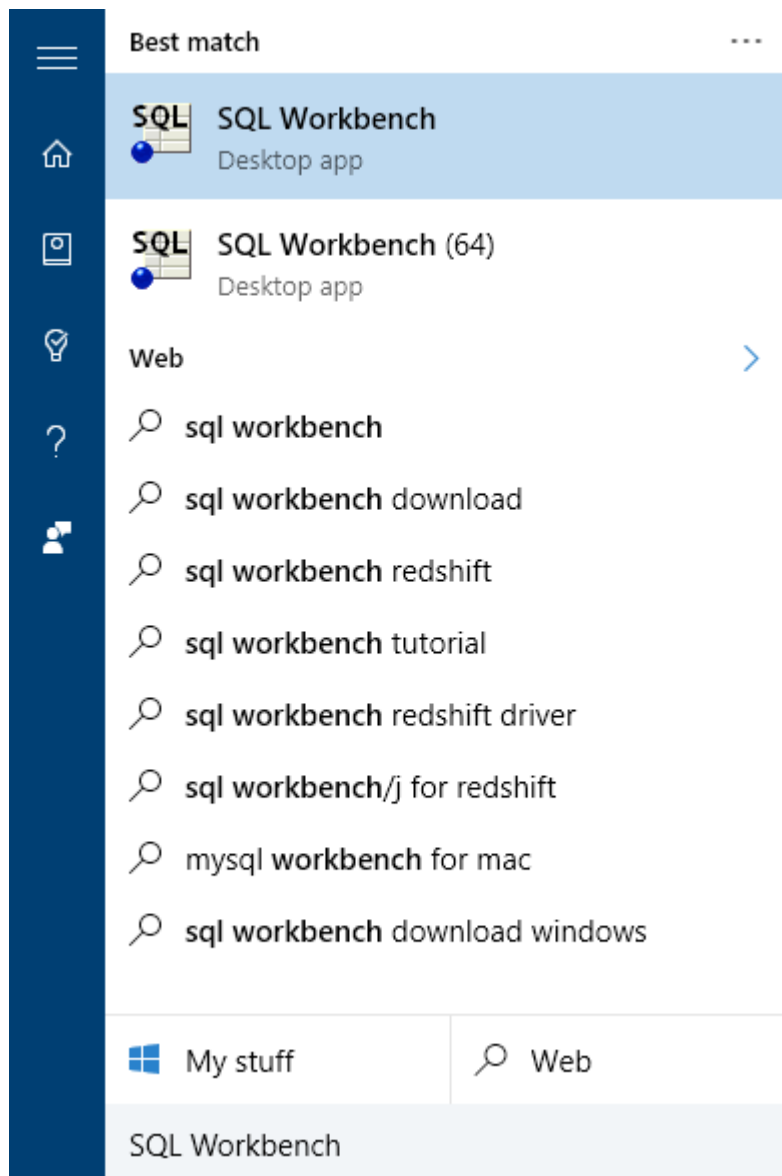

Follow the installation wizard instructions.

Make sure you check both **JDBC** and **SQL Workbench** sections.

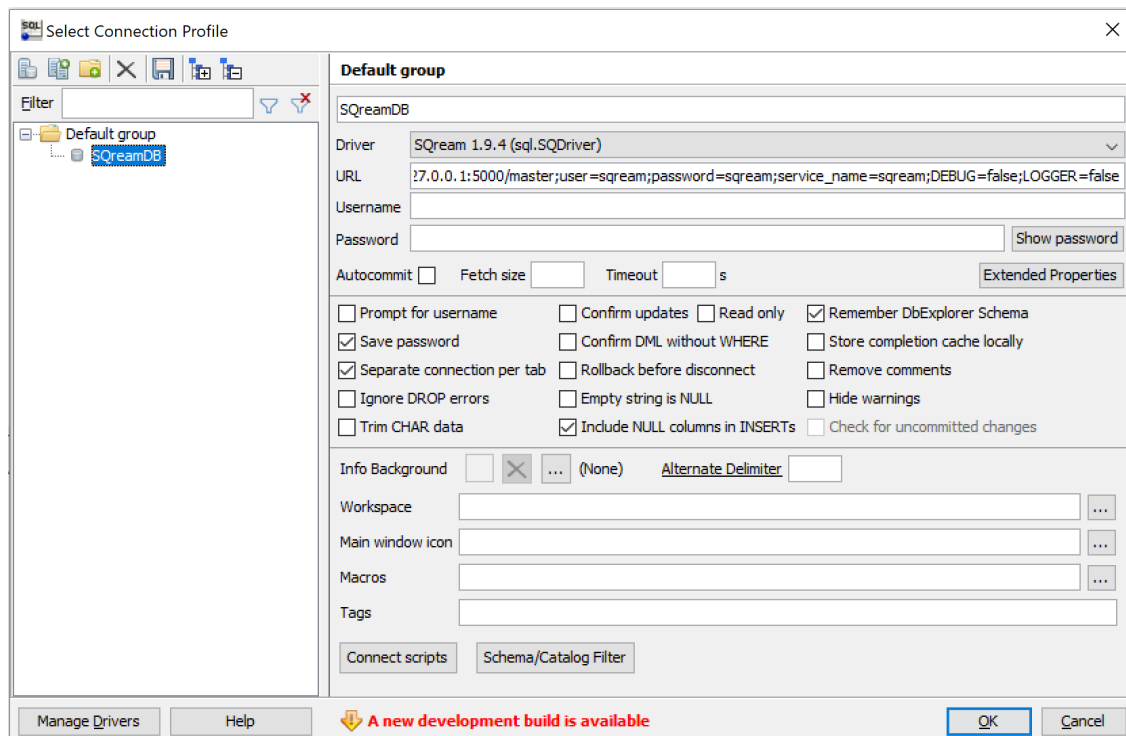

2. You should now have a Start menu item for SQL Workbench.

Hit the **Windows** button on the screen or keyboard, and type **SQL Workbench**. Select either the 64 bit or 32 bit variant, depending on your preference.

3. Open SQL Workbench. A **New Connection** window should be displayed with the SQream driver already selected.

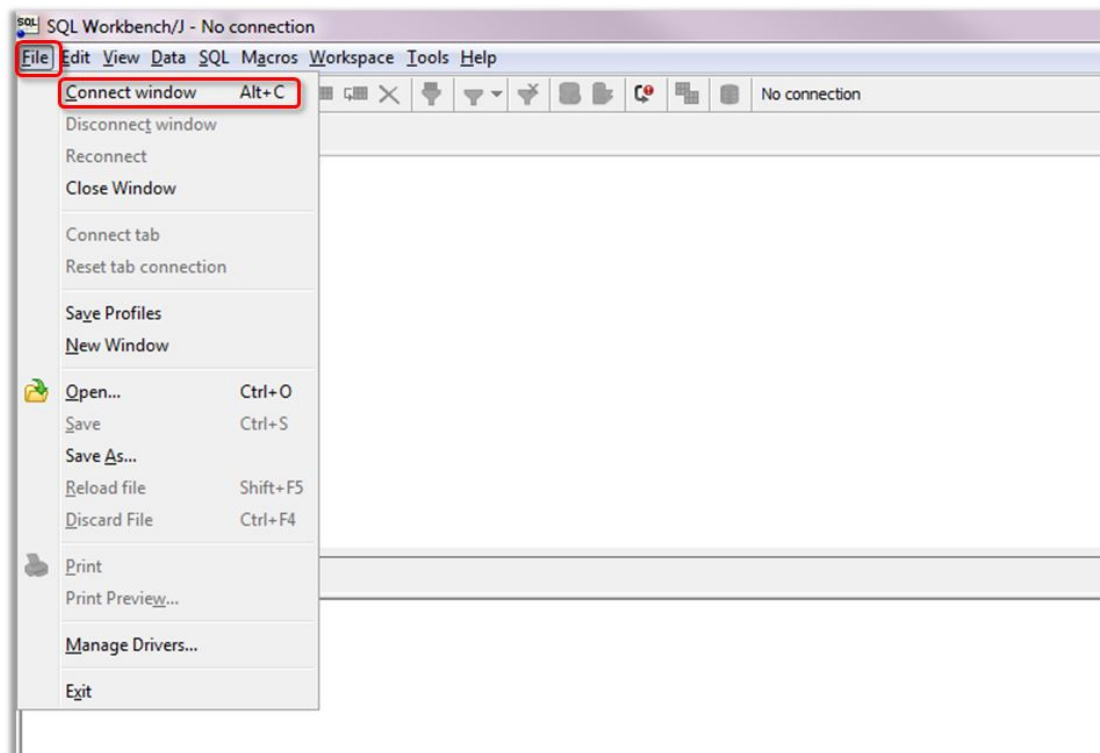

4. Fill in the connection string URL (obtained from SQream).
5. You are now ready to start querying data!

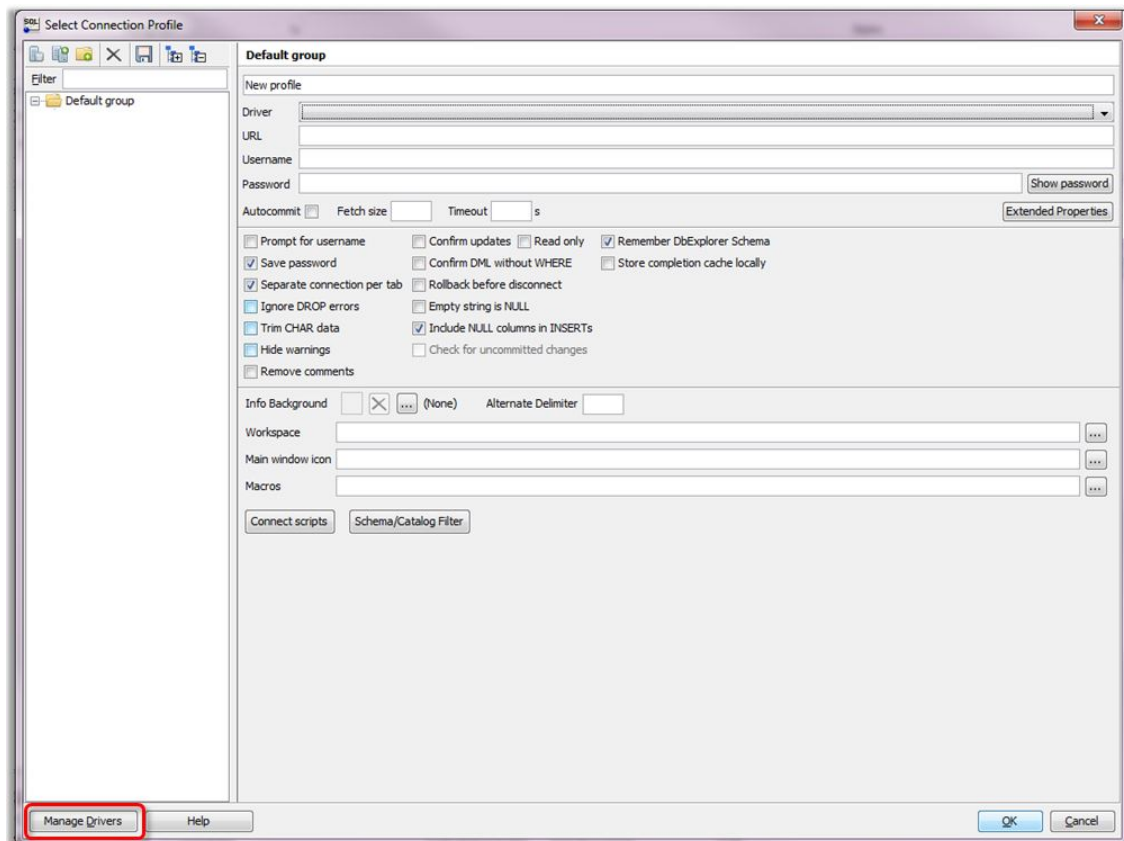

## Configuring an existing Workbench installation manually

### (Linux/MacOS)

1. Install SQL Workbench according to the instructions relevant to your OS.
2. Download the SQream JARs, and unpack them into a directory of your choice.  
You can obtain the latest JARs here: <https://sqream.com/product/client-drivers/>
3. Open SQL Workbench, and define a connection profile:
4. Click **File -> Connect window (Alt+C)**

5. Click **Manage Drivers**.

6. In the Manage Drivers window do the following:

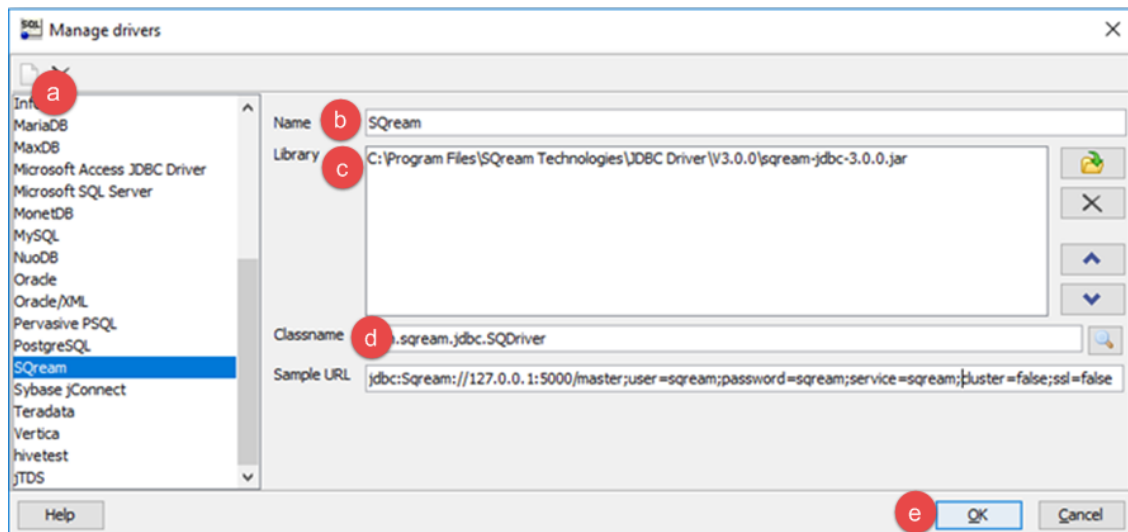

- Click **Add new driver** (white paper icon)
- Name the driver.
- Enter the location of the JDBC drivers.

If you used the SQream installer, they should be located in

**C:\Program Files\SQream Technologies\JDBC Driver\**

- The class name should appear as **sql.SQDriver** automatically
- Click **OK** to save and return to the **New Connection** screen.

## 7. Create a connection to your service/DB:

- Create a new connection.
- Name the connection.
- Select the SQream Driver you created in Step 6.
- Fill in the JDBC connection URL (obtained from SQream).

It is typically in the general format:

```
jdbc:Sqream://<ip>:<port>/<db_
name>;user=<user>;password=<pass>;service=<service>;cluster=<true or
false>;use_ssl=<true or false>;
```

- Save the connection settings.
- Click **OK** to connect your service/DB.

The following additional steps are recommended after closing SQL Workbench:

- Locate your **workbench.settings** file:
  - On Windows, typically: %HOMEPATH%\sqlworkbench\workbench.settings
  - On \*nix, \$HOME/.sqlworkbench
- Add the following line at the end of the file:

```
workbench.db.sqreamdb.schema.retrieve.change.catalog=true
```
